XProtect® Express

The Open Platform Company

The fastest way to video enable businesses

With support for up to 48 cameras, XProtect Express is affordable video management software (VMS) for small, single-location companies that need an easy way of incorporating video into their existing business operations.

Businesses can integrate third-party applications, such as analytics and building management systems, directly into XProtect Express to create a surveillance solution with one common interface. A unified interface is faster to learn and makes it

easier to control installations. Flexible licensing options and the open platform ensure seamless upgrades and system expansions as security and business needs change.

XProtect Express is an ideal solution for retailers because it supports add-on software specially designed to link transaction data with video to optimize store operations. With unique search tools to help quickly locate incidents, it is easy to export video and create evidence to provide to public authorities.

User-friendly features for effective evidence handling

Sequence Explorer

XProtect Express is powered by XProtect® Smart Client, an operator interface that has a rich feature set for viewing cameras, investigating incidents and exporting evidence. Adaptable for users of different skill levels, XProtect Smart Client gives access to all integrated third-party software. XProtect Express also supports XProtect Web Client, a simplified web-based user interface that gives access to all of the most commonly used functions, such as viewing, playing back and sharing video.

Collecting video evidence is easy with search tools that help locate video quickly. The Sequence Explorer shows thumbnail previews of captured video and time intervals, allowing users to browse through recorded video to find incidents. Smart Search is a feature for searching for motion in one or more selected areas of images from a particular camera.

With XProtect Smart Client, evidence can be exported in multiple formats, and comments can be added to a complete export or to an export from an individual camera. Evidence can also be shared quickly in JPEG or AVI format using XProtect Web Client.

Seamlessly expands for future growth

Upgrading and expanding systems is easy with XProtect Express. All of the XProtect products share common features and clients so users can adapt to upgraded products quickly and efficiently.

With the open platform found in XProtect Express, users can customize surveillance installations by mixing different camera brands depending on needs and budget. Additionally, it is easy to add and replace cameras individually and implement future innovations and technologies into an existing installation. With XProtect Express the transition to IP surveillance is gradual and seamless because digital security technologies can be blended with existing analog security cameras.

With features ideal for small businesses such as:

Support for up to five concurrent users

Language support for 26 languages

Software wizards guide users through the process of adding cameras, configuring video, scheduling recordings, adjusting motion detection and managing users.

Video motion detection is built into the software and detects and records motion independent of camera model

Pan-tilt-zoom (PTZ) control is integrated into the software so users can control cameras with a joystick or by using automatic presets

System alarms help ensure immediate detection of problems with cameras and other components

Privacy masking enables administrators to define privacy masks for individual cameras to hide areas in the camera view that must not be visible or recorded in order to comply with local legislation

Archive to network storage enables users to centrally archive video evidence for long-term storage in a more cost-effective alternative, such as network-attached storage (NAS)

Integrate third-party software to solve any challenge

XProtect Express supports analytics and third-party integration through the Milestone Integration Platform (MIP). With a MIP plug-in integration, Milestone Solution Partner applications and third-party business solutions can be directly embedded into XProtect software. Additionally, XProtect easily integrates with existing systems, such as access control, so users can add video to systems and manage them all through one interface. Integration into XProtect Smart Client enables users to monitor and control all of the systems in a surveillance installation, such as license plate recognition, video analytics, point-of-sale (POS) and people counting. A unified client application is not only more efficient, it also requires less training for new personnel.

Application integrations are a cost-effective way to add additional functionality to installations because all premium XProtect products support MIP. As users upgrade and expand surveillance, all of the plug-in integrations will seamlessly connect to the system.

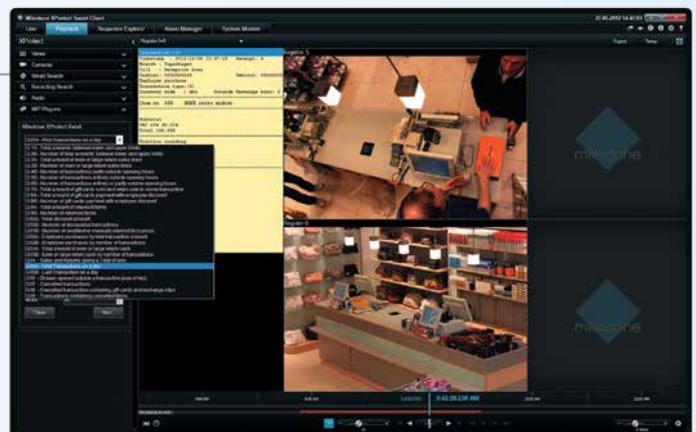

Third-party integration

Cost-effective solution for retailers

XProtect Express is the ideal platform for building flexible and scalable IP video solutions for a wide variety of businesses, especially retail. It supports XProtect® Retail and XProtect® Transact, two add-on products that efficiently monitor customers, transactions and merchandise to improve the bottom line. Both products link transaction data with corresponding video from relevant cameras, helping to verify transactions and reduce fraud.

XProtect Retail

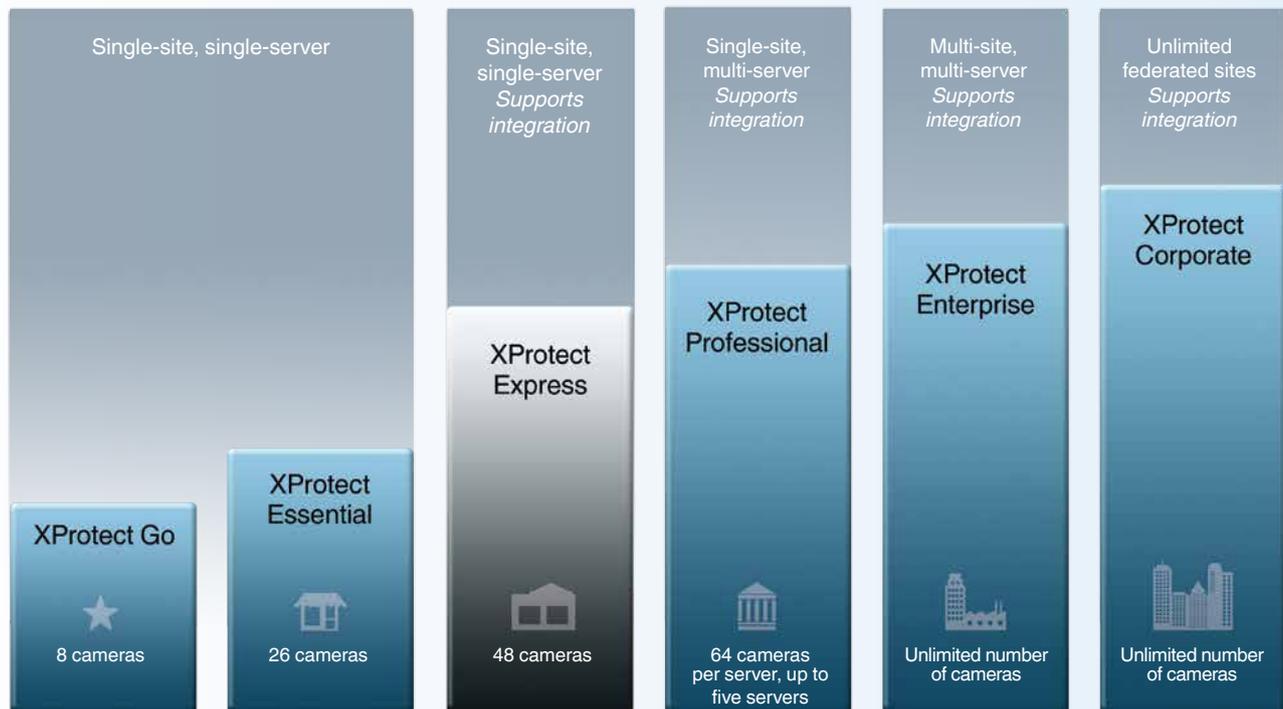

The Milestone Open Platform

A foundation for long-term success

Milestone's XProtect open platform video management software (VMS) integrates with the industry's widest choice in cameras, giving you the freedom to choose equipment according to your needs and budget. Committed to providing a true IP video open platform and freedom of choice, Milestone is proud to be among the first VMS vendors to support and lead the future progress of ONVIF and PSIA standards.

Integrate applications and systems into XProtect VMS with the Milestone Integration Platform Software Development Kit (MIP SDK). The open architecture of XProtect, together with the MIP SDK, allows for endless possibilities to add features and functionality for creating powerful, custom surveillance solutions.
